Strategy Overview

Ardea's pure relative value (RV) investment specialisation is fundamentally different to conventional fixed income investing and therefore we customise our quarterly portfolio commentaries accordingly.

As our portfolios are inherently high turnover, highly diversified and designed to generate uncorrelated returns from a repeated investment process averaged over time:

- performance is the cumulative result of interactions between many of modestly sized trades that were entered, exited, and held over the preceding months
- performance is generally driven by many small gains / losses, rather than a few key contributors
- performance is not driven by broader bond / equity market fluctuations
- a single quarter is generally not enough time to draw meaningful conclusions about performance themes

Therefore, we customise the quarterly portfolio commentary in the following ways:

- Consider quarterly performance in isolation only when there is outsized performance volatility, unusually concentrated performance drivers and / or noteworthy portfolio changes.
- Consider quarterly performance in a longer-term context, with reference to the Fund's investment objectives and the roles it plays in the broader portfolio.

Investment Objectives

The Fund's investment objectives encompass both the magnitude of returns generated ('size' of return) and the risk characteristics underlying those returns ('style' of return), resulting in a unique combination of risk / return attributes that cannot be obtained from conventional fixed income investments.

These attributes link to the underlying theme of defensive risk diversification.

² The Fund's inception date is 18/03/2010.

Portfolio Commentary

The portfolio delivered a return of +0.15% relative to the benchmark index for the quarter.

Rolling quarterly performance remains within the normal range of expected performance variability, based on the portfolio's volatility target.

As usual, performance drivers were diversified across small gains / losses generated by many modestly sized trades, with no unusually concentrated performance drivers.

Curve RV strategies contributed negative performance. (+0.10%)

Bond RV strategies contributed positive performance. (+0.32%)

Option exposures contributed negative performance. (-0.02%)

Inflation RV strategies contributed positive performance. (+0.06%)

Explanatory Notes

- The normal range of expected performance variability is defined relative to the portfolio's volatility / TE target (1.0% p.a.). Based on this, quarterly excess returns should mostly be within a range of -0.2% / +0.8% (1 std dev band, 68% of sample) and sometimes outside this range, but no wider than -0.7% / +1.2% (2 std dev band, incremental 27% of sample).
- Curve RV strategies seek to profit from RV pricing anomalies in the shapes of interest rate curves.
- Bond RV strategies seek to profit from RV pricing anomalies in specific government bonds.
- Option exposures stem from RV trades that involve buying interest rate options. These exposures are biased to outperform in periods of market stress and are used to balance risk vs other types of RV trades that may temporarily underperform at such times.
- Inflation exposure stems from RV driven divergences in the portfolio's breakeven inflation exposure relative to the benchmark index.
